

The Doctoral School in Law organises a cross-disciplinary doctoral seminar on Information Technology and Law on data protection law. The seminar will be attended by doctoral students and young scholars in law and in computer science. This diverse audience will benefit from such cross-disciplinary approach and cross-sectorial methodology. While the main focus of the seminar is the same for the speakers, they will address the topic in a complementary way.

Therefore, the learning goal of the seminar is to foster a cross-sectorial dialogue between researchers in Legal AI and researchers in IT Law, thus promoting cooperation between these increasingly intertwined areas. On the one hand, lawyers will see how ongoing research projects in Legal AI re-conceptualise the law in technical terms; On the other hand, computer scientists will experience how law and regulation impact and limit the uses of IT technologies in modern application.
